```

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA motif) an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an NGN triplet), a cinzyme (cleaving RNA with an NGN triplet), a cinzyme (cleaving RNA of CD20 in the presence of a divalent cation that is preferably MG^2.+ Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level

```
therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-Cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma, leukaemia, B-Cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lymphoma (NHL), immunocytoma (IMC), small B-Cell lymphocytic lymphoma, (NHL), immunocytoma (IMC), small B-Cell lymphocytic lymphoma, immunocytoma (IMC), small B-Cell lymphocytic lymphoma, immunocytoma (IMC), small B-Cell lymphoma, content and inflammatory arthropathy. The NOGO-cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the contested acid may be contacted with a cell to reduce NOGO activity of the NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), parkinson's disease, ataxia, Huntington's disease, Centrafeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

```
The present invention provides single-stranded oligonucleotides which can oble used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor VI, Factor IX, haemoglobin alpha locus apolipoprotein E (APOE), LDL receptor (LDLR), WDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin-1 (PSENI) and presenilin-2 (PSENI) and scancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting

Arabidopsis thaliana VRNI. This protein and coding sequences of Arabidopsis thaliana VRNI. This protein is capable of altering the vernalisation responses of a plant. Also provided are a number of PCR primers used to isolate the sequences. The sequences are useful in the production of crop plants, where they are able to control the timing of Inversing, the duration of vernalisation required, the optimum temperature, or even eliminate the need for vernalisation completely. The present sequence is a PCR primer used to isolate the VRNI coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting extracellular mutated oncogene DNA in animal without clinically
                                                                                                                                                                               Novel VRN1 polynucleotide sequence encoding a polypeptide which alters vernalization response of plant in which VRN1 nucleic acid is expressed.
                                                                                                                                                                                                                 useful for influencing and assessing vernalization phenotype of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutant, K-ras, oncogene, p53, tumour suppressor, detection, blood; extracellular tumour-associated nucleic acid; plasma; serum; human; neoplastic; premalignant; proliferative disease; colorectal adenoma; cervical dysplasia; atypical squamous metaplasia; bronchial dysplasia; atypical squamous metaplasia; bronchial dysplasia; atypical hyperplasia; dysplastic nevi; Barrett's oesophagus; cancer; prostatic intraepithelial neoplasia; atypical endometrial hyperplasia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides single-stranded oligonuclectides which can be used for the targeted alteration of genomic sequences, where the oligonuclectide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin.

CC retinoblastoma, BRCAL, BRCAZ, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor VII, Factor IX, haemoglobin alpha locus (CDKNZA), amyolid precursor protein (HDLR), mUDP-glucuronosyltransferase (GGTI), amyolid precursor protein (APC), presentian-1 (PSEMI) and presentian-2 (PSEM2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, alzenient's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0

-diagnosed cancer, involves preparing and enriching mutated oncogene DNA, amplifying enriched DNA and detecting the product of amplified DNA.

Disclosure; Page 22; 53pp; English.

mutated oncogene DNA (I) in blood (B) from a human or animal without clinically-diagnosed cancer, which involves preparing (I) or its fragment from (B), enriching (I) by concentrating and/or isolating (I) from the cremaining extract, amplifying enriched (I) or a signal from enriched (I), or described are: (I) determining (D2) the presence of non-hammopoletic cells or tissue having a mutated oncogene allele in a human without clinically-diagnosed cancer; and (2) determining (D3) an acquired clinically-diagnosed cancer. D1 is useful for quantitatively and clinically-diagnosed cancer. D1 is useful for quantitatively and clinically-diagnosed cancer. D1 is useful for quantitatively and clinically-diagnosed cancer D1 is useful for quantitatively and cancer. D1 is useful for quantitatively and cancer. D1 is useful for quantitatively detecting extracellular mutated oncogene DNA in blood from the presence of non-hammopoietic cells or tissues having a contact of non-hammopoietic cells or tissues having a mutated oncogene allele in a human without clinically diagnosing cancer. CC D1 is useful for determining an acquired predictive risk factor for a non-hammopoietic cells or tissues having a contact of non-hammopoietic cells or tissues having a contact of the pre-mallignant conditions, and in particular to conditions inclinically diagnosed cancer. The assessment of pre-mallignant conditions, and in particular to conditions The present invention describes a method for detecting (D1) extracellular mutated oncogene DNA (1) in blood (B) from a human or animal without including colorectal adenoma, cervical dysplasia, atypical squamous metaplasia of the lung, bronchial dysplasia, atypical hyperplasia of the breast, prostatic intraepithelial neoplasia, atypical endometrial hyperplasia, dysplastic nevi of the skin or Barrett's oesophagus. The present sequence represents a mutant p53 oligonucleotide related to a mutant involving codon 175 which is the most common mutation in ollorectal carcinoma, given in the exemplification of the present

Apparatus and method for performing a large number of chemical and biological reactions by bringing two arrays into close apposition and allowing reactants on the surfaces of the two arrays to come into

Example 11; Fig 18B; 112pp; English.

contact

The invention provides a novel system for performing reactions, that comprises a first solid support with a reactant of each reaction immobilized on to it, and a second solid support either providing a second reactant confined to a specific area on the surface, or a chemical /mechanical separation of the reactions, where the first and second solid supports are assembled to provide an environment for performing the reactions in parallel. The methods and apparatus are useful for performing a large number of chemical and biological reactions, especially polynucleotide amplification reactions and the detection of sequence variations, expression levels and their functions. The method is capable of generating large amounts of data or products per unit time by carrying out large numbers of reactions in parallel. The process is also amenable to full automation. Sequences AAF83164-179 represent probes used in detecting amplified products by allele specific extension, the products amplified by performing large numbers of PCR reactions using array-immobilised and releasable primers

diagnosing infections or detecting genetic abnormalities, comprises producing and detecting double-stranded hybrids between probes and the Detecting a target nucleic acid, for identifying microorganisms target nucleic acid.

Claim 53; Page 25; 128pp; English.

The invention relates to detecting a target nucleic acid comprising (a)

```
thy bridising a single-stranded or partially single-stranded target nucleic acid to a capture sequence probe and a signal sequence probe to form double-stranded hybrids between the probes and the target nucleic acid, where the capture sequence probe and the signal sequence probe acid, where the capture sequence probe and the signal sequence probe acid, concleic acid and not hybridising to each other. (b) adding a blocker probe to the hybridisation reaction, where the blocker probe hybridises to excess non-hybridised capture sequence probes, (c) binding the hybrid to a solid phase to form a bound hybrid, and (d) detecting the bound chybrid. The method is used to detecting a target nucleic acid. The method is used to detecting a target nucleic acid. The method is used to detecting a target nucleic abnormalities, infectious diseases, add measuring response to various types of treatment. The method is also useful for detecting the presence of concleic acid in test samples. The method is not only rapid and sensitive, but is also highly specific and capable of discriminating highly concleotides complementary to the capture sequence probes are used in the method collamonal signal in detection and increasing specificity of the assay.

Che method is good to eliminate excess apture sequence probe, thus reducing the background signal in detection and increasing specificity of the assay.

The present sequence is a blocker probe derived from HSV-1, HSV-2, HPV or

                         The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90749, ABB90770 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenic activity. They are useful for inhibiting tumour growth, neoangiogenesis in subjects bearing a vascularised tumour, polyoystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABB92075-ABH92141 and ABB90712-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL92041 and ABL92143-ABL92191; normal endothelial markers (MEM) ABL92044, and pan-endothelial markers oligonucleotide sequence is that of an oligonucleotide marker useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify concleic acids in samples, as amplification substrates, to nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart can skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form pat of the printed specification, but was obtained in electronic format directly from WIPO concert figures as production of the present did not form pat of the present and patent of patented by sequence of the sequence of th
                                                                                                                                                                                                                                                                                                                                               New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:8907.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                    The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-

c protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-

c can be used as probes to detect, characterise and quantify

mucleic acids can be used as probes to detect, characterise and quantify

c hGDMLP-1 nucleic acids in samples, as amplification substrates, to

provide initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

c expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

cused as immunogens to raise antibodies that specifically recognise hGDMLP-

c used as immunogens to raise antibodies that specifically recognise hGDMLP-

c and/or amount specifically of hGDMLP-proteins, as specific biomolecule

and/or amount specifically of hGDMLP-proteins, as specific biomolecule

capture probes for surface-enhanced laser desorption ionisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

colynucleotide sequence represents an oligomer used in the screening of the

The present invention describes a human genome-derived myosin-like protein 1 (hGPMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically proteins, as specific biomolecule and/or amount specifically proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the exemple of hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the repeated entry and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines of the hGDMLP-1 is localised for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and should be accounted by the production and in vaccines or for replacement therapy. The construction and in vaccines of the hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention, N.B. The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify cacles initial substrates for the recombinant engineering of hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionization, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders, hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form pat of the printed specification, but was obtained in electronic format directly from MIPO at figure properties of the present directly from MIPO at figure properties of the present directly from MIPO at figure production.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify browlde initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP as specifically of hGDMLP as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

                                                                                                                                                                                                                                                                                                                                                              à
```

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-

Disclosure; SEQ ID NO 706; 214pp; English.

```
nucleic acids can be used as probes to detect, characterise and quantify
chorder inteled acids in samples, as amplification substrates, to
provide initial substrates for the recombinant engineering of hGDMLP-1
c provide initial substrates for the recombinant engineering of hGDMLP-1
c protein variants having desired phenotypic improvements, and for
expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
cused as immunogens to raise antibodies that specifically recognise hGDMLP
c used as immunogens to raise antibodies that specifically recognise hGDMLP
c used as immunogens to raise antibodies that specific ally recognise hGDMLP
c used as immunogens to raise artiface-hhanced laser desorption ionisation, as
c and/or amount specifically of hGDMLP proteins, as specific biomolecule
c apture probes for surface-enhanced laser desorption ionisation, as
c therapeutic supplement in patients having specific deficiency in hGDMLP-1
c production, and in vaccines or for replacement therapy. The
c production, and in vaccines or for replacement therapy. The
c production, and in vaccines or for replacement therapy. The
c production, and in vaccines or for replacement therapy. The
c production, and in vaccines and having specific deficiency in hGDMLP-1
c production, and in vaccines. HGDMLP-1 may be used for diagnosing a
disorder associated with the expression of hGDMLP-1, in particular heart
c and skeletal muscle disorders. HGDMLP-1 is localised to chromosome 22.
The present sequence in the exemplification of the present invention. N.B.
The sequence data for this patent did not form part of the printed
c specification, but was obtained in electronic format directly from WIPO

The present invention describes a human genome-derived myosin-like

C c can be used in gene therapy and vaccine production. The HGDMLP-1

C c can be used in gene therapy and vaccine production. The HGDMLP-1

mucleic acids can be used as probes to detect, characterises and quantify

mucleic acids can be used as probes to detect, characterises and quantify

CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1

provide initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

capture probes for surface-enhanced laser describion in onfaction.

and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule

capture probes for surface-enhanced laser description indisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production associated with the expression of hGDMLP-1, in particular heart

and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B.

CC The present sequence in the exemplification of the present invention.

CC Specification, but was obtained in electronic form at directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·

Chen W,

Rank DR,

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, or provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines of for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hobMLP-1 sequence this patient did not form part of the pripted content of the pripted conten specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

                                                                                      ABN00716
```

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 con be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing in instance in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines of for replacement therapy. The prosent sequence represents an oligomer tased for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed Disclosure; SEQ ID NO 708; 214pp; English.

and/or amount specifically of HGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the DMGMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequence proteins, as standards in assays used to determine the concentration

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or ammont specifically of hGDMLP proteins, as specific bicmolecule capture probes for surface-enhanced laser describin in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart can and sheltal muscle disorders. hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·;
                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an oligomer used in the screening of the MDMLP-1 sequence in the exemplification of the present invention.                                                                                                                                                                                                                                                          KTOMI (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOMI nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOMI.

Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOMI which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTOMIa (ABQ63232)
                                                                                                                        New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic
                                                                                                                                      acids encoding the protein, useful for treating subjects having defects in KTOMI which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, KTOMla; KTOMl; kidney tumour overexpressed membrane; cytostatic; gene therapy; cancer; kidney; liver; bone marrow; brain; heart; lung; kidney; colon; skeletal muscle; testis; uterus; placenta; probe; ss.
                                                                                                                                                                                                                                              The invention relates to a novel isolated nucleic acid encoding human

New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOM1 which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.
                                                                                                                                                                                                                                                          KTOMI (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOMI nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOMI.

Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOMI which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTOMIa (ABQ63232)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, KTOMla; KTOMl; kidney tumour overexpressed membrane; cytostatic; gene therapy; cancer; kidney; liver; bone marrow; brain; heart; lung; kidney; colon; skeletal muscle; testis; uterus; placenta; probe; ss.
                                                                                                                                                                                                                                             The invention relates to a novel isolated nucleic acid encoding human

New human kidney tumor overexpressed membrane (KTOMI) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOMI which can manifest as cancer of the kidney, or as a disorder of
                                                                                                                                                                                                                                                                        The invention relates to a novel isolated nucleic acid encoding human KTCM1 (Kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTCM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTCM1. Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTCM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTCM1a (ABQ63232)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a trypsinogen, which is a protease (I) isolated from Engraulis japonicus (Also called Engraulis japonicus or Japanese anchovy). The present invention also describes: (1) a DNA encoding (I), or encoding a protease consisting of an amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protease; trypsinogen; sardine; Japanese anchovy; fish sauce; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4.1%; Score 11.8; DB 1; Length 17; 86.7%; Pred. Nucleic acid encoding human UDP-GalNAc:polypeptide N-cetylgalactosaminyltransferase 10 protein is useful to diagnose, prevent and treat disorders associated with reduced or over expression of the encoded protein.
                    The present invention describes an isolated nucleic acid (I) encoding a human UDP-GalNAC:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, BC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7411.2. (I) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or treat a disorder associated with decreased expression or activity of pp-GaNTase. The sequences given in ABV85011 to ABV86699 and ABP53502 to ABP53504 are given in the exemplification of the present invention. N.B. The sequence data for this parent is not represented in the printed specification but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10; pp-GaNTase 10; EC 2.4.1.41; chromosome 7q11.2; gene therapy; scanning;

```

The present invention describes an isolated nucleic acid (I) encoding a

Example 2; SEQ ID NO 81; 59pp; English

```
Nucleic acid encoding human UDP-GalNAc:polypeptide N-cerylgalactosaminyltransferase 10 protein is useful to diagnose, prevent and treat disorders associated with reduced or over expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated nucleic acid (I) encoding a human UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, EC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7q11.2. (I) can be used in gene therapy. Molecules of the
                                                                 −ďď
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10;

human UDP-GalNAc:polypeptide N-acetylgalactosaminyltransferase 10 (pp-GaNTase 10, EC 2.4.1.41) protein. Human pp-GaNTase 10 is located to chromosome 7411.2. (1) can be used in gene therapy. Molecules of the present invention can be used in therapy, particularly to prevent or treat a disorder associated with decreased expression or activity of pantase. The sequences given in ABVBSG11 to ABVBSG89 and ABPSS502 to ABPSG89 and ABPSS502 to The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications

for

consist of o-methyl modification, an LNA modification, two or more phosphorothioate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved conferring amino acid over production), herbicide resistance (e.g. ultritional value (e.g. altering amino acid over production), herbicide resistance (e.g. resistance, porphyric herbicide resistance en triazine resistance), disease resistance, modified oil production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil 

production.

quentic sequence, which comprises a single-stranded oligomucleotide
c genetic sequence, which comprises a single-stranded oligomucleotide
having a DNA domain. The DNA domain has at least one mismatch with
c having a DNA domain. The DNA domain has at least one mismatch with
c respect to the genetic sequence to be altered and further comprises
c chemical modifications of the oligomucleotide. The chemical modifications
c consist of o-methyl modification, an LNA modification, two or more
c consist of o-methyl modifications. The Modification of plant genetic information of any two or
more of these modifications. The oligomucleotides are useful for
directing repair or alteration of plant genetic information. The
coligomucleotides are particularly useful for creating plants with desired
phenotypes, e.g. environmental or abiotic stress tolerance, improved
contexting amino acid content of plants or
nutritional value (e.g. altering amino acid content of plants or
conferring amino acid over production), herbicide resistance, improved
c glyphosate resistance, imidazolinone and sulphonylurea herbicide
c glyphosate resistance, modified oil production of waxy starch), altered floral
c morphology (e.g. male-sterile plants) or modified fatty acid content
c morphology (e.g. male-sterile plants) or modified fatty acid content
c c grant expective or production of waxy starch), altered floral
c malysis of photosynthetic processes. This sequence represents a genome
c altering oligomucleotide of the invention ಗ ŏ The invention relates to an oligonucleotide for targeted alteration Claim 7; Page 102; 220pp; English.

Male-sterile plant producing genome altering oligonucleotide #76.

Chromosomal genomic alteration; genome altering oligonucleotide; PCR; ss; o-methyl modification; LNA modification; phosphorothioate linkage; bub repair; DNA alteration; environmental tolerance; hygromycin; abiotic stress tolerance; improved nutritional value; hygromycin; primer; amino acid over production; herbicide resistance; glyphosate resistance; porphyric herbicide resistance; sulphonylurea herbicide resistance; porphyric herbicide resistance; triazine resistance; modified oil production; modified starch production; waxy starch; and altered floral morphology; male sterile plant; albino mutant; increased stearate production; reduced palmitate production; albino plant; increased stearate production; reduced linolenic acid production; photosynthetic process.

Nicotiana tabacum

```
The present invention relates to human testis expressed Patched like

protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL

chas two isoforms, with a few single base pair differences between the

two. One of the single base pair changes introduces a premature stop

codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for more of these modifications of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        conferring amino acid over production), herbicide resistance (e.g. glyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, prophyric herbicide resistance or triazine resistance), disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil

```
protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB9850). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopp codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL chares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares are structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating a potential tumour suppressor. HTPL is consecuted to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human CHTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic agents for calinically useful diagnostic markers and potenial therapeutic agents for example from the invention

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human control of such disorder associated with decreased expression or activity of human changes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potental therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, well and conditions acidenced in the cancer and conditions acidenced in the cancer and would healing. (I) is useful for treating a patient having a condition soler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically caramine genetic drift and mutations with ERG gene or ERG fusion genes. ABK1334-ABK22719 represent nucleic acids, including antisense and caramic muchaic modecules which regulate expression of ERG, and caramic muchaic muchaic modecules which regulate expression of ERG, and caramic muchaic mutation.

Novel cell having pre-trans-splicing molecules with target binding domains that target binding of PTM to pre-mRNA, 3' or 5' splice region, spacer region, nucleotide sequence to be trans-spliced to target-pre-

Example; Page 80; 229pp; English.

The present invention describes a cell (I) comprising pre-trans-splicing molecules (PTMS) (II) which have one or more target binding domains (IIa) that target binding of PTM to pre-mRNA, 3' splice region (IIa) that target binding of PTM to pre-mRNA, 3' splice region (IIb) that includes branch point pyrimidine tract and 3' splice acceptor site, or 5' splice site (IIc), spacer region (IId) that separates RNA splice site from target binding domain, and nucleotide sequence to (IIe) be transspliced to target-pre-mRNA, Optionally, the cell comprises (II) either comprising: (A) (IIb) and (IIe), or (B) (IIC), (IId) and (IIe). The cell may comprises a recombinant vector expressing (II) (I) has cytostatic, immunosuppressive and antimicrobial activities, and can be used in gene therapy. (II) comprising one or more (preferably two or more) (IIa) and (IIe), (IId) and (IIe), or (II) comprising either (A) or (B) (excluding (IId)), is useful for producing a chimeric RNA molecule in a cell which involves contacting a target pre-mRNA expressed in the cell with that is recognised by nuclear splicing components. The chimeric RNA produced comprises sequences encoding a toxin or translatable protein. The nucleotide sequence to be trans-spliced to target pre-mRNA preferably comprises nucleotide sequences comprising exons 1-10 of cystic fibrosis trans-membrane conductance regulator (CFTR). The chimeric RNA molecule produced using (II) which either comprises (A) or (B) further comprises a nucleotide sequence tag (I) can be used for gene regulation gene repair and targeted cell death. (I) can be used for the treatment of proliferative disorders such as cancer and to regulate gene expression in plants. ABQ73414 to ABQ73536 represent sequences used in the gene repair and targeted cell death. (1) can be used for the treatment of various diseases including genetic, infectious or autoimmune diseases and exemplification of the present invention

New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration

New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid sequences associated with tumor suppression, regression,
                                                                                                                                          This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           with tumour suppression or regression, apoptosis or virus resistance, invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an isolated nucleic acid sequence associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.

The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal and identified in human ECs. The human EC marker proteins and the polynucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriasis. They are also useful for inhibiting necangiogenesis or tumour angiogenesis, for inducing an immune response to tumour endothelial cells in a patient, or for identifying candidate drugs for treating tumours. ABX72067-ABX72116 represent human TEM DNA tags
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           purified human transmembrane protein, designated as tumor endothelial

```
candidate for a particular course of therapy to treat a vascular disease or disorder. The method comprises determining the identity of the nucleotide present at specific positions, or their complements, and identitying the subject as a candidate for a particular clinical course of therapy based on the identity of the nucleotide present in that specific position. The method can be used for identifying a subject who is a candidate for identity of the nucleotide present in that copredite position. The method can be used for identifying a subject who is a candidate for further dispositic evaluation of a vascular disease or disorder and selecting a clinical course of therapy. The products of the invention have cardiant, antiarteriosclerotic and cerebroprotective cortivity and can be used for gene therapy. The methods disclosed are useful for treating a vascular disease, e.g. atherosclerosis, coronary arcent y assender and a fingerprint for detecting the pulmonary embolism. The DNA sequences are useful as fingerprint for detecting different individuals within the same species applicable in forensic studies and paternity the testing. This sequence represents a primer used to illustrate the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a subject as a candidate for a particular course of therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for identifying a subject as a

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for vector or antibodies directed against the polypeptides acids, cells containing the vector or antibodies directed against the polypeptides and or cells containing the corporation, specifically cancer but also Alzheimer's disease and degeneration, specifically cancer but also Alzheimer's disease and containing the schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these containing the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the horsonion continuers of protein chips. The nucleic acid sequences of the horsonion can be used in gene chips. The nucleic acid sequences of the horsonion can be used in gene contained to a sequence of the provence of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           therapy. New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 85; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, diven in the specification, a sequence containing at least 15 consecutive condidios from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that of alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acid acids of the invention are useful as probes and primers for detecting, identifying admol and for amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, concaining the polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, dentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as [anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and degeneration, specifically cancer but also Alzheimer's disease and patient samples is useful for diagnosis and/or prognosis of these chips. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression crelated human fukutin oligomucleotide of the invention
                                                                                                                                                         New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 10 A; 2 C; 4 G; 1 T; 0 U; 0 Other;

(MOLE-) MOLECULAR ENGINES LAB.

The invention relates to a novel isolated 17 mer nucleic acid sequence, cg iven in the specification, a sequence containing at least 15 consecutive given in the specification, a sequence ontaining at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alighment, at least 80 % identity to the 17 mer sequence, a sequence that thybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and continued and analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chise and set the polypeptides can also be used to generate antibodies, and contained both the polypeptide and antibodies are useful as components of protein the polypeptide and antibodies are useful as components of protein the polypeptide and antibodies are useful as components of protein the polypeptides or also be used to generate antibodies, and contain the polypeptides or also be used to generate antibodies, and contain the polypeptides or also be the invention can be used in gene New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 303; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that of alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colpreptides, vectors containing the nucleic acids, cells containing the proparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of parine nucleic acids in patient samples is useful for diagnosis and/or prognosis of these components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymetide sequence represents a tumour suppression contained buman fukutin oligonucleotide of the invention

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 470; 720pp; French

The invention relates to a novel isolated if mer nucleic acid sequence, given in the specification, a sequence, a sequence with, after optimal nucleotides from the 17 mer sequence, a sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, dentifying quadricylor amplicylor and for acids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colls containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for the preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tunours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene the containing and antibodies are useful as components of protein the polypeptide and antibodies are useful as components of protein the contain and sequences of the invention can be used in gene the the polyment of sequences of the invention can be used in gene the the polyment of sequences of the provence of the services of the services and ser invention relates to a novel isolated 17 mer nucleic acid sequence tumour suppression therapy. Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases. The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRB), where (I) is an inozyme, zinzyme, G-claaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted too treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG/2+. The enzymatic antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or therapies such as monoclonal antibodies, REL-A-specific inhibitors or the respection. chemotherapy including pacitraxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such rheumatoid arthritis, restencisi, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury strous system (CNS) and myocardial), glomerulonephritis, lergic airway inflammation, inflammatory bowel disease or This sequence represents the substrate of a novel enzymatic Mcswiggen J, Draper KG; Claim 3; Page 34; 72pp; English. New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 588; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p21.2 and MDZ12 is encoded at chromosome 15p21.2 and MDZ12 is encoded at chromosome 25p2 or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross are alerations in MDZ3, MDZ4, MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

The invention relates to a novel short interfering RNA (SIRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic rheumatic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ65531, ABZ65520 - ABZ66524, ABZ665310 - ABZ66530 - ABZ66531, ABZ66531 , ABZ66531, ABZ665
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HEV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. BNAzymes, independent acids such as hammerhead ribozymes. BNAzymes, independent acids and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and/or the specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV DNA. The nucleic acids may be used to modulate the expression of HBV COMPOUNDS and/or potential therapies disclosed is a method for screening compounds and/or potential therapies disclosed is a method for screening that modulate the expression and/or replication of HCV. The compounds the expression and the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present invention

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and aptamers that bind to HBV reverse renucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well are nucleic acids may be used to modulate the expression of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds that modulate the expression and/or replication of HCV. The compounds that methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene

                                                                                                                                    ₹
```

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense

```
and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and garamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV BNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies disclosed is a method for screening that modulate the expression and/or replication of HCV. The compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAZYME or minus strand DNAZYME sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and environmental relationship of the programment of the synthesis, amberzymes, and 9-cleaver ribozymes. Also disclosed inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse compounds and HBV viral replication. Also disclosed is a method for screening compounds and viral replication also disclosed is a method for screening that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV invention.
                                 Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; dibNazyme; inozyme; zinzyme; amberzyme; G-claever ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymes by a such as hammerhead ribozymes. Blazymes, and enzymes, and enzymes, and enzymes, and goldeaver ribozymes. Also disclosed inozymes, zinzymes, and enzymes that bind to HBV reverse transcriptase primer sequences, as well care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV cas oligonucleotides may be used to modulate the expression of HBV cas only only and replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene catchom as cirrhosis, liver failure, and hepatocellular carcinoma The present sequence represents a substrate for one of the HBV carcinoma in nozyme, inozyme, d-cleaver, zinzyme, DNAzyme or amberzyme sequences compounds in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule, Hepatitis C virus, HCV, Hepatitis B virus, HBV, RNA stability, RNA expression, RNA synthesis, antisense, enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme, decol molecule; aptamer; antisense transcriptase; Enhancer I region; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                              Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                ü
                                                                                                                                                  Lee

Hepatitis B virus.

WO200281494-A1 17-OCT-2002. SS.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, can encleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds that modulate the expression and/or replication of HCV. The compounds compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HVV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV circhem.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·,
                                                                                                                                                                                                                                                                                                                                                                               Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                 New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                                                                                             ACC68866), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that see characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          eful for preparation viral diseases that
quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of agene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases the are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Murine oligonucleotide associated with tumour supression, SEQ ID 2206.

```
The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene ohlp; in virus as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                            Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oligonucleotides have improved sequence specificity for a single-stranded target, reduced toxicity, and improved biological activity as antisense molecules. The present sequence represents a cooperative oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide composition used to, e.g. treat mammal infected by human immunodeficiency virus, comprises synthetic oligonucleotides linked to binding partner consisting of cyclodextrin, adamantane, streptavidin, or
Cooperative oligonucleotide; binding partner; cyclodextrin; adamantane; streptavidin; pharmaceutical composition; nucleic acids expression; HIV; acquired immunodeficiency syndrome; AIDS; anti-HIV; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an oligonucleotide composition comprising a first and second synthetic cooperative oligonucleotides linked to their respective binding partner consisting of cyclodextrin, adamantane, strepteavidin, or biotin. Each oligonucleotide has a region complementary to a tandem, non-overlapping region of a target nucleic useful as a pharmaceutical composition to inhibit the expression of nucleic acids in vitro, or for treating a mammal infected by HIV or by acquired immunodeficiency syndrome (AIDS). The cooperative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Osteopathic, Gene therapy; High Bone Mass; HBM; LRP5; Zmax1; LRP6; bone mass modulation; osteoporosis; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                            ·
                                                                                                                                                                                                                       The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. Or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of tumours or diseases characterized by development of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         or cell degeneration (e.g. Alzheimer's disease or schizzphrenia). Analysis of the expression of the mucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive mucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the sequence having at least 80% identity, after optimal alignment, with the uncleotides, as sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, and identifying, quantifying and/or amplifying nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transagenic animals, as crecembinant polypeptides, and to prepare transagenic animals, as caperimental models. The nucleotides (also vectors containing the wectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and on prepare and polypeptides can be used for prepared the containing the vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used to screen for their specific interactive molecules

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

Disclosure; Page 307; 771pp; French.

The invention relates to the isolation of 6127 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a

sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the conditions with the nucleotides or the nucleotides or primers for detecting, can antisense sequences, of nucleotides or primers for detecting, can antisense sequences, of nucleotides involved in tumour complication, apoptosis and or viral resistance, to produce experimental models. The nucleotides (also vectors containing them and capture or containing the vectors), the encoded polypeptides and antibodies (calls containing the vectors), the encoded polypeptides and antibodies (calls containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or call degeneration (e.g. Alzheimer's disease or schizophrenia).

Co reall degeneration (e.g. Alzheimer's disease or schizophrenia).

Co and/or prognosis of these diseases. The nucleotides and polypeptides can also be useful for treating diseases associated with abnormal ö cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia; The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies. New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

Disclosure; Page 301; 771pp; French.

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, not nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour

Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the protein,

Example 2; SEQ ID NO 33; 149pp; English.

The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to (I), a sequence in which at least 95% of deviations from (I) are conservative substitutions, or a fragment of at least 8 contiguous amino acids of (I). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide. (I) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused by altered expression of GAPN, by determining the level of expression of GAPN in a sample of nucleic acids or proteins that derives from a subject expression providing diagnostic and/or monitoring information. (I), (II)

```
or agonist of (I) is useful for treating or preventing a disorder associated with decreased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN (all claimed).

(I) is useful as immunogen to raise antibodies that specifically recognize GAPN proteins. (II) is useful to drive in vivo expression of GAPN proteins, and as hybridization probes to detect, characterize and quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acid samples. This sequence represents a 17-mer oligonucleotide spanning the GAP_N DNA sequence.
                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 1 A; 7 C; 6 G; 3 T; 0 U; 0 Other;

Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the protein.

Example 2; SEQ ID NO 32; 149pp; English.

The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (1), a sequence having 65% identity to (1), a sequence in which at least 95% of deviations from (1) are conservative substitutions, or a fragment of at least 8 contiguous amino acids of (1). The polypeptide is useful for identifying a specific conservative substitutions, or a fragment of at least 8 contiguous amino acids of (1). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide. (1) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused CAPN in a sample of nucleic acids or proteins that derives from a subject Suppected to have the disease, alterations from a normal level of CAPN in a sample of nucleic and/or monitoring information. (1), (II) or asponist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN (all claimed).

The invention describes an isolated or recombinant polypeptide (I)

comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in

the specification, or a conservative variant; (b) encoded by 1 of 30

sequences (S2), as given in the specification, or a conservative variant;

(c) encoded by a sequence that hybridises under stringent conditions to

S2; and (d) encoded by a sequence 70 % identical to S2. The expression or

activity of (I) is modulated to modulate a plant growth trait in a

flowering plant, of the family Brassicaceae, preferably in a plant that

is Arabidopsis, Brassica, Zaa, Oryza, Triticum, Hordeum, Lolium, Sorghum,

Clycopersicon, Capsicum, Gosspium, Havea, Linnum, Prunus, Citrus, Populus,

Pinus, or Quercus. A new method is used to detect genes for a plant

growth trait. This sequence represents a polynucleotide isolated from the
                                                                                                                                                                                                                         .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated or recombinant polypeptide for use in modulating a plant growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or
(I) is useful as immunogen to raise antibodies that specifically recognize GAPN proteins. (II) is useful to drive in vivo expression of GAPN proteins, and as hybridization probes to detect, characterize and quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acid samples. This sequence represents a 17-mer oligonucleotide spanning the GAP. NDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plant growth; plant growth trait modulation; Brassicaceae; Arabidopsis; Brassica; Zea; Oryza; Triticum; Hordeum; Lolium; Sorghum; Glycine; Medicago; Helianthus; Lactuca; Beta; Vitis; Solanum; Lycopersicon; Capsicum; Gossypium; Hevea; Linum; Prunus; Citrus; Populus; Pinus;

                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of identifying a class I or II Human Leukocyte Antigen (HLA) genotype of a subject using hybridisation and amplification assay. The method is used for determining the HLA genotype of a subject. The present sequence represents a HLA class I allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SB188 for elongation mediated multiplexed analysis of HLA-B.

Concurrent interrogation of a number of polymorphic sites, useful for genetic testing, carrier screening, genetic profiling, and identity testing, comprises conducting a multiplexed elongation assay using
 multiplexed elongation assay; enzymatic recognition; cystic fibrosis conductance transmembrane regulator.
          conductance transmembrane regulator.
                                                                                                                                                                                                                                                            Example 9; Page 48; 143pp; English

The invention describes a composition comprising at least one expression vector comprising a polynucleotide of the invention. The composition has anorectic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and treat conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obesity, athersclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polynucleotide differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADE30691;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 804
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADE30691/c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for the concurrent interrogation of a number of polymorphic sites in the presence of, and without interference from, non-designated polymorphic sites. Specifically, it comprises conducting a multiplexed elongation assay by applying one or more temperature cycles to achieve linear amplification of the target or controlled conditions. Furthermore, this detection method uses probe extension or elongation and relies on enzymatic recognition, a superior controlled conditions. Furthermore, this detection method uses probe extension or elongation and relies on enzymatic recognition, a superior controlled conditions furthermore probes and methods useful for identifying or detecting polymorphisms at one or more designated sites, such that they can identify mutations within the cystic fibrosis conductance can identify mutations within the cystic fibrosis conductance transmembrane regulator (CFTR) or the human leukocyte antigen (HIA) genes. In addition, concurrent interrogation of a multiplicity of polymorphic sites is useful for genetic testing, carrier screening, genotyping or genetic profilling, and identity testing. This oligonucleotide is a human probe used for the elongation mediated

""" and "Liplexed analysis of HIA-B," in an exemplification of the invention.

This oligomer contains methylphosphonate linkages except for positions 1, 7 and 16 which are phosphate diester bonds. The oligomer is complementary to the area around the polyA signal of the HSV-1 ULB gene. ULB is one of the essential beta-genes and the protein it encodes forms a complex with two other proteins which functions as a primase and helicase. The oligomer can interfere with expression and function of the gene. See
                                                                                        Polynucleotides differentially regulated in response to cholesterol and adipogenesis are useful to detect and treat associated conditions such as obesity, athersclerosis, diabetes mellitus and coronary artery heart
                                                                                                                                                                                                       The invention describes a composition comprising at least one expression vector comprising a polymucleotide of the invention. The composition has anorectic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and treat conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obesity, athersclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polymucleotide differentially expressed during cholesterol homeostasis and adipogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methylphosphonate oligomer #0022 complementary to HSV-1 polyA signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Herpes Simplex Virus; type 1; beta-gene; ULB; primase; helicase; ss.

A mutation in an analogous segment of a hWLH1 or hPMS1 nucleic acid isolated from a subject, can be detected by comparing it with the above gene fragment. This method can be used to diagnose cancer susceptibility, or to identify and classify a DNA
                                                                        ·,

Obesity polypeptide(s) able to modulate body wt. - useful for e.g. reducing wt. in treatment of diabetes, high blood pressure and high reducing wt. in treatment of diabetes cholesterol and for cosmetic reasons.

Example 10; Page 142; 304pp; English.

AAT16392-T16429 represent amplification primers for the human obesity to amplify the OBP gene sequence (see AAT16373). These sequences were used to amplify the OBP gene sequence from the YAC contig containing the human OBP gene, in a series of sequence tagged-site (STS)-specific PCR assays.

There were 19 5TSS found within the YAC contig human OBP gene sequence. This sequence was used in conjuncture with AAT16429 to amplify the STS wSS2367. OBP has effects on both food intake and energy expenditure. OBP and its analogues are useful for modifying body weight (optionally combined with known medicaments), for treating diabetes, high blood pressure or high cholesterol. The OBP coding sequence (and sequences complimentary to it) can be used in gene therapy for modifying body weight. The protein can be used for reducing weight for health or cosmetic reasons in obese humans, or to produce leaner food animals. Antagonists of OBP (including antibodies) are useful for increasing body weight, e.g. for treating weight loss associated with cancer, or for cosmetic reasons in humans, or for production of Kobe beef or Foie gras in domestic animals. Of DBP antibodies (ABP) can also be used in diagnostic immunoassays for the presence of OBP. The formation of Ab-OBP complexes enables in vitro evaluation of levels of OBP in a sample, especially to detect diseases associated with elevated or decreased levels, and to monitor treatment of these diseases

WPI; 1996-321852/32.

New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.

Claim 4; Page 57; 72pp; English.

AAT50699-T50754 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hairpin ribozymes (see AAT50643-T50698).

CETP is a 74 KD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then complete to cleave mRNA from the gene encoding CETP, thereby thousand or expression of the mRNA. By inhibiting CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the cell minated) thereby preventing the reduction in size density of the high concreasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically atherosoclerosis, peripheral vascular disease, hyperbetalipoproteinaemia, dyslipidaemia, complications of diabetes, transplant, atherosoclerosis, familial hypercholesterolaemia, hypoalphalipoproteinaemia, vascular complications of diabetes, transplant, atherosoclopy and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density createnosis. By inhibiting CETP, the receiver and angioplastic decrease in LDL), and the HDL:LDL ratio are favourably altered (a chicasse in LDL) levels, and a corresponding increase in LDL levels). The ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the ribozymes target specific regions of the CETP gene, they have low non-specific activity

The present sequence is the sense oligonucleotide -20 for the human WSX receptor can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist constructe the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be differentiation of a cell expressing the WSX receptor. It can also be considered to decrease body weight and/or fat-depot weight and/or food intake in a obses mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, especially a human, is sufferentiation therapy or bone marrow transplantation therapy. Consucted by sufferentiation therapy or bone marrow transplantation therapy. The products of the used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, consistence, hypercholesterolaemia, hypertriglyceridaemia, cancer and consistence in the product of the consistence in the consist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WSX receptor and related antibodies and ligands - used to develop products for diagnosis and therapy, e.g. for improving haematopoiesis or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fl-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like; tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

ŏ g Human eosinophil major basic protein antisense oligonucleotide.

Asthma; airway epithelium; adenosine free; cystic fibrosis; chronic obstructive pulmonary disease; bronchitis; ss.

```
The present sequence is the antisense oligonucleotide -20 for the human WSX receptor cDNA. The receptor can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell inneages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy of the analso be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, officiality, dermatological disorders, hypertansion, insulin can entity in the constant of the can also be used to repopulate blood cells in a mammal. The products of the constant of the can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, createriation, insulin the call of the ca

```

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human cosinophil major basic protein. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine- induced bronchoconstriction in patients

with hyper-reactive airways

Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     q
                                                                                                                                                                                                                                                                                                                               AAV48485-564 represent antisense oligonucleotides directed against the p53 gene. Of these, only oligonucleotides AAV48485-517 resulted in effective downregulation of negative growth by p53 and increased cell proliferation, while AAV4858-64 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides chat contain B-30 mucleotides, which contain at most B nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The coligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErbB-2, juns, jund, TGF-beta I or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The above proteins, other than ALK-7, are protein tyrosine phospharases.

(C above proteins, other than ALK-7, are protein tyrosine phospharases.

(I.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is cancer (e.g. leukaemia and special and Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides cancoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the proteins. The present sequence represents a RACE primer for human SAD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ó
                                                                                                                     New mucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.

·,
                                                                                                                                                                                              The present sequence represents a nucleic acid primer used in amplifying the Chlamydia trachomatis ltuB gone. The nucleic acid is used for the detection of Chlamydia trachomatis by nucleic acid amplification, especially by thermophilic strand displacement amplification. The detection of Chlamydia trachomatis is used to diagnose trachoma, inclusion conjunctivitis, infant pneumonitis, urethritis and lymphogranuloma venereum, which are all caused by the microbe. The product obtained is the C. trachomatis ltuB gene, which is responsible for production of specific mRNA transcripts produced in the infectious
Chlamydia trachomatis derived primers and probes - used for the specific detection of the microbe with nucleic acid amplification and strand displacement reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human RhoC phosphorothioate antisense oligonucleotide SEQ ID NO:155.

compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with cc criteria, and evaluating in silico the binding of the virtual ONS with a compounds that modulate the expression of a method of defining a set of the tompounds with the tNA. The methods can be used for the generation of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are antisense drug discovery and target validation. A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the

Example 18; Page 97; 264pp; English.

library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set the tNA according to defined criteria; and (2) a method of defining a set of compounds with the tNA. The methods can be used for the generation of the compounds with the tNA. The methods can be used for the generation can didentification of synthetic compounds having defined physical, chemical or bloactive properties. Information gathered from assays of such compounds is used to identify nucleotic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAZ50001 to AAX52706, represent sequences used in the exemplification of

Antisense compound inhibiting expression of human G-alpha-13.

Claim 11; Col 38; 38pp; English.

This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha-13, such as Camer

SNS-2a is a sodium channel protein. SNS-2a can be used in a method for the identification of a modulator of a sodium channel, and for assaying for compounds which modulate sodium flux. The sodium channel modulators can be used in a medicament for the treatment

The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonuclectides may be derived from sequences AXX5222-74. These multiple target oligonuclectides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, respiratory cute asthma, allergies, asthma, impeded respiration, respiratory pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphonas, carcinomas e.g. noma, kidney cancer, melanoma, hepatic metastases, as cancers which may metastasize or have metastasized including breast and prostate cancer Sequence 18 BP; 0 A; 6 C; 4 G; 8 T; 0 U; 0 Other; hepatocellular carcinoma, kidney

BP

Nucleotide sequence of control motif from IL-2 promoter (-160). (first entry) 03-DEC-1999

```
This is the nucleotide sequence used as a control for an investigation into the possible role of Inducible cAMP Early Repressor (ICER) in Fas 19and gene expression. ICER may be involved in downregulating the activity of a wide variety of genes involved in downregulating the immune response. In particular, ICER binds to a number of recognition sites present in the promoters of genes encoding cytokines critical to the immune response. The agent which decreases the level of ICER expression can be used in the preparation of a medicament for increasing the activity of an immune cell. This is useful for the treatment of an individual suffering from a condition which reduces immune cell activity. Such conditions include cancer and infection with a pathogenic organism. There is a need for therapeutic strategies which prevent or reduce downregulation of the host immune response such as outlined in this invention. For example, cancer cells may induce the production of prostaglandin E 2 (FGE 2) in neighbouring normal host cells such as macrophages. PGE 2 inhibits the proliferation of Teals, therefore a reducing the ability of the host immune system to destroy the cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               primer used to amplify exons and introns of human marenostrin DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New agents for the blockade of inducible cAMP early repressor (ICER)-mediated inhibition of immune cell activity.
                         immune regulation; cytokine expression; cAMP; DNA binding domain; 3',5' - cyclic adenosine monophosphate; autorepressor; promoter; ds; infection; cancer; Fas ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4.1%; Score 11.8; DB 1; Length 18; 86.7%; Pred.
